

Candidate test

Privet!

Thank you for the brief interview. This document contains a short task we would like you to complete before moving forward. The time estimated for the task is set to < two hours.

We would also ask you to complete a short personality test. In the end of the test, there is a button to retrieve the results by email. Please do so and forward to ebsp@subit.dk or send it to Natallia along with the code test.

You can find the test here: www.16personalities.com

N.B. there is no right or wrong, it's simply to get to know you better.

Please reach out if any questions.

The task

As API's will be the heart of our product, we'd like you to make a simple Angular or React frontend, integrating with a simple API.

The frontend should be able to convert an amount of money between any of the provided currencies.

You may use the API: <http://fixer.io>

We would like to see:

- ★ A solution that is simple to spin up locally with e.g. npm, webpack.
- ★ Clean and reusable code.
- ★ A simple, good looking UI that is easy to use.

If you have time left, the following features would be cool

- ★ Possibility to convert amounts based on rates from the past by selecting a date (historical data).
- ★ Possibility for the user to provide a custom exchange rate.

You can either zip the result and send it or create a repo on github and provide the URL.
